

3

Product-level Update

Syncer constructs and sends the necessary requests to ensure that the equivalent product on the online store matches with the ones on the physical store. If no such product exists, it creates it.

4

Variant-level Update

For each variant, the same is done as step 3, but with variant-specific properties.

5

Inventory Update

For each variant, Syncer ensures that their inventory listings match with the physical store's inventories.
